Local Computer ShowAllPorts Activation Code is a tool designed to get a complete list of the serial ports on a Windows computer. According to the developer, the utility works with built-in ports, virtual ports and USB-to-RS-232 adapters. The setup is a quick and uneventful operation that does not need any special attention on your part. The application comes with a clean single window interface that displays the ports, their details and whether they are currently available or busy. In case one is busy although you have nothing connected, then perhaps it is a matter worth investigating. The list can be refreshed whenever a new device or service is launched with a click of a button. At the same time, the app allows users to add new ports. A further function worth mentioning is the one that shows the last port to be connected to the computer. This can come in handy for users who already have numerous ports installed.

Photographer Anna Woitaszek spent five days documenting Congolese women and girls in a beauty salon and a market in Entebbe's neighborhood called Tchokoto. The area is home to hundreds of widows, and about half of those widows are disabled or live in extreme poverty. Many of them are women who fled their homes to live with relatives or settle in the area. "Life in Entebbe is hard and women have to do everything from cleaning houses to going to school," Woitaszek said. "It's dangerous if you don't have a job." Women in the areas, many of whom are Catholic, also say they feel mistreated and exploited. "They don't want to work," Woitaszek said. "They don't have work

permits so they don't want to give their labor for free."
